

## Backend Assignment

You'll have to use Express.js (or any other framework of your choice). Using TypeScript is a plus.

Declare a variable with multiple pet dogs with their name and age (see example below)

```
const pets = [
  {
    "name": "PNut",
    "age": 3,
  },
  {
    "name": "Bashi",
    "age": 5,
  },
]
```

Write code to send a sorted response, sort the pets by their age in ascending/descending order using query parameters, something like this:

`https://example.com/pets?sort=ASC`

`https://example.com/pets?sort=DESC`
